Types of Manuscripts

The Journal accepts **Original articles, Review papers, Technical notes and Case Studies**

Original articles: The Journal publishes original research and experiments that have quantitative results and which make a significant contribution to the existing corpus of knowledge in the field. The results must follow from the experimental observations and be adequately supported by a statistical analysis and a large enough sample size. Conclusions must be supported by the results. Superlative or opinionated words or phrases such as “I believe”, “I think”, etc, are not acceptable. Surveys will generally not be published. For more information, see the ‘For Authors’ section at the website.

Review papers: Review papers must address and describe potential gaps in current quantitative knowledge, non-obvious, non-intuitive incorrect implicit assumptions and/or limitations in the current knowledge base, methodology or design and suggest research trajectory, methods, or design to address these deficiencies. **Reviews that merely present and collate current literature will generally not be published.** The Journal does not publish commentary and/or opinion papers.

*The Journal recognizes that our vision of what a Review paper is differs from the conventional view; where a Review paper is a survey of previously published research. We require students to think above-and-beyond the currently accepted paradigms and extract/extrapolate/ information from published research that has not yet been published. This need not be ground-breaking or novel; but should still be a new way of thinking about the problem and proposing a solution. Publication of a review paper in the Journal of High School Science differentiates students who are meticulous, thoughtful and knowledgeable from those who can **additionally** connect disparate concepts in a coherent way, think and/or speculate about the problem differently than has been done before and pose implementable solutions.*

Technical notes: A technical note is a concise document that presents the findings of a short experimental analysis or investigation. It typically focuses on a specific technical topic or problem and provides a condensed summary of the methodology, results, and conclusions of the study. Technical notes are often used to communicate preliminary or limited research findings, share experimental techniques or innovations, or provide brief updates on ongoing projects. A concise report introducing or demonstrating a method, workflow, or analytical approach, often validated on limited data can also serve as a Technical note.

Case studies: A Case study describes a clinical or epidemiological situation(s) - often unique, misdiagnosed, an outlier, or uncharacteristic of accepted clinical practice, protocol, diagnosis, symptoms or treatment. Case studies can be fictional but will need to be explicitly described as such.

Quick guide for submission

1. Submit your manuscript as a .docx file or equivalent with one-column, Times New Roman 12 Font text. Line spacing should be 1.15, Left and right margins should be 1 inch and top and bottom margins should be 0.5 inches. Paragraphs must be separated by a blank line. Do NOT indent paragraphs. There is NO limit to the number of pages and/or number of words in the manuscript body.
2. Subheading # and subheading title should be bold. Sub-Sub heading # should be bold and Sub-Sub-Sub heading title should be italicized. Tables should be included at appropriate locations in the text.
3. Each figure should be submitted separately as its own JPEG or PNG file without title or legend. Figure legends should be submitted separately as a .docx file or equivalent. Figure legends should NOT be part of the figure JPEG.

4. References should be numbered and sequentially presented in the text at appropriate locations in curved parenthesis (Vancouver style). The References should correspond with those in the References section at the end of the manuscript.
5. Equations must be numbered with an (eqX) to distinguish them from references. The microsoft equation software can be used to generate equations.
6. References in the references section must be formatted in APA style. A live link DOI must be included after each reference.

Ideas for Research

The following represent unconceived or under-researched knowledge areas. This intellectual property is being made freely available. Should you derive inspiration from - and decide to pursue - any of them, we encourage you to submit any resulting publication to the Journal of High School Science. In any event, please acknowledge the Journal of High School Science in any resulting publication. We will be happy to provide you with more information.

1. **Dimensional analysis:** ▼
2. **Fractional Voting system:** ▼
3. **Design drugs that decrease target protein mutation:** ▼
4. **Tariff mitigation strategies:** ▼
5. **Tumoristatic or tumoricidal organoids:** ▼
6. **Elemental or compound compositions that work like rare-earth metals:** ▼
7. **Top-down construction of alloy-templated nanometer transistors:** ▼
8. **Design CART cells to exhibit a Th2 to Th1 polarization:** ▼
9. **Engineer a reverse water transport system in plants:** ▼
10. **Do Shingrix vaccine excipient immunostimulants modulate NK-cell populations to decrease dementia and Alzheimer's disease:** ▼

11. CAR-T manufacturing protocol should attempt to recapitulate the post chemo-radiotherapy epigenetic profile of the T-Cells of cancer patients in remission: ▼
12. What's different about the food at Michelin Starred restaurants: ▼
13. Build with post-tensioned concrete blocks: ▼
14. Add expiration dates to paper or digital currency: ▼
15. Produce Hydrogen and water from Liquified Petroleum Gas at point-of-use: ▼
16. De-vulcanization of Tyres: ▼
17. Bio-engineered yogurt - "Open Source" Medicine: ▼
18. Change Hydrocarbon combustion reaction pathway: ▼
19. Smart Strings: ▼
20. Pressure cooker whistle frequency design to notify when food is cooked: ▼
21. Genetically modify plants to secrete Varroa mite resistant pollen : ▼
22. Predicting Earthquake Timing Through Pre- and Post-Rupture Signal Relationships : ▼

Tracking your manuscript after submission

Ignore progress bars at the website. Instead, navigate to the **Metrics page**, then scroll down to , **Current Review Timeline** (<https://jhss.scholasticahq.com/pages/776-metrics>) to obtain information on when your manuscript is expected to be reviewed.

Office hours

If you have any questions or need clarification before/during/after submission and/or review, **we will be happy to google meet with you between 7:30 AM and 8:00 AM Central Standard Time (USA) on any day.**

Send us an email at journalofhighschoolscience@gmail.com

(<mailto:journalofhighschoolscience@gmail.com>), along with your email address,

indicating what date you would like to meet and we will send you a google invite, minutes before the meet. Please be courteous and cancel beforehand; should you be unable to attend for any reason. Note that we only populate these times when we receive a request to meet.

Title Page

Title: Concise and informative. Titles are often used in information retrieval systems. Avoid abbreviations and formulae where possible.

Author names and affiliations: Where the family name may be ambiguous (e.g., a double name), please indicate this clearly. Present the authors' affiliation addresses (where the actual work was performed) below the names. Indicate all affiliations with a lower-case superscript letter immediately after the author's name and in front of the appropriate address. Provide the full postal address of each affiliation, including the country name, and, the e-mail address of each author.

Corresponding author: Clearly indicate who will handle correspondence at all stages of refereeing and publication, also post-publication. Ensure that telephone and fax numbers (with country and area code) are provided in addition to e-mail address and the complete School affiliation postal address.

Present/permanent address: If an author has moved since the work described in the article was done, or was visiting at the time, a "Present address" (or "Permanent address") may be indicated immediately below the affiliation address. The address at which the author actually did the work must be retained as the main, affiliation address.

Abstract: It should contain a brief and clear description of the aims of the paper, its principal results and major conclusions in one paragraph. The abstract should include all keywords pertinent to the subject. References should not appear in an abstract.

Keywords: Indicate no less than 10 Keywords. They should be carefully selected in order to improve accessibility of scientific information in the manuscript. Keywords commonly used in international abstracting services are preferred.

Main Body

Research papers must contain Introduction, Materials and Methods, Results and Discussion, Conclusion and References. Results and Discussion may be combined into one section if appropriate. For Review papers or Technical notes, appropriate sections may be selected.

Policy and Ethics: The work described in the article must have been carried out in accordance with the Code of Ethics of the World Medical Association (<http://www.wma.net/e/policy/b3.htm>) (Declaration of Helsinki) for experiments involving humans; EC Directive 86/609/EEC for animal experiments (http://ec.europa.eu/environment/chemicals/lab_animals/legislation_en.htm); Uniform Requirements for manuscripts submitted to Biomedical journals (<http://www.nejm.org/general/text/requirements/1.htm>).

Statement of informed consent: Patients have a right to privacy that should not be infringed without informed consent. Identifying information, including patients' names, initials, or hospital numbers, should not be published in written descriptions, photographs, and pedigrees unless the information is essential for scientific purposes and the patient (or parent or guardian) gives written informed consent for publication. Informed consent for this purpose requires that a patient who is identifiable be shown the manuscript to be published. Authors should identify Individuals who provide writing assistance and disclose the funding source for this assistance. Identifying details should be omitted if they are not essential. Complete anonymity is difficult to achieve, however, and informed consent should be obtained if there is any doubt. For example, masking the eye region in photographs of patients is inadequate protection of anonymity. If identifying characteristics are altered to protect anonymity, such as in genetic pedigrees, authors should provide assurance that alterations do not distort scientific meaning and editors should so note.

Materials and Methods: It should include materials, standard techniques and procedures relevant to the study. Published procedures and techniques should be cited unless significant modifications are involved. Exact specification of relevant materials and equipment must be stated. Chemical terms must conform with IUPAC rules. Trademarks or commercial products must be labelled using a superscripted (R). Names of products and equipment mentioned must be accompanied by the name of the manufacturer or distributor, location with state or country. This information must be stated in parentheses in the text. Any potential hazards connected with materials and procedures must be mentioned. A precise and detailed description of the procedure should be given that is sufficient for carrying out any repetition of the work.

Statistical approach: The number of repeat measurements and the variance must be clearly depicted in the text and in the illustrations. Reasonable significant figures must be used.

General Format: Please use Microsoft Word default style settings, i.e., Normal and Times New Roman 12. Subsections use subsection number as bold and heading as italicized. Sub-sub-sections use no bold and heading italicized. Leave only one (1) space after periods. Do not use spaces to create indents. Use line returns only at the end of paragraphs and do not put blank lines between paragraphs. Use the Symbol font for symbols and special characters. Equations should be numbered consecutively with Arabic numerals in parentheses on the right side of the page. SI units should be used throughout. Use proper superscripts and subscripts; not raised or lowered text.

Figures: Figures must be submitted SEPARATELY from the main body of the text as SEPARATE JPEG files. They must be numbered in Arabic numerals in the order in which they are cited in the text, and designed to fit the column of page size of the Journal. All parts of a figure must be “grouped” with no segmented text box. Left justify the title in normal Font Size 10 below the figure. Keys to symbols should be a part of the figure, and

not a part of the caption. Use the same typeface for all figures. Labels should be in title case. Figure legends should be informative and self-explanatory and submitted as a separate file; NOT as part of the Figure JPEG.

Tables: Tables should be numbered consecutively with Arabic numerals, referred to by number in the text and designed to fit the column of page size of the Journal. Prepare numerical illustrations (e.g., tables) using the “table” function (rows and columns) when ever practicable. Do not style the tables or make them using text functions such as tabs, spaces or lines. Hide lines except under the column headings. Left justify the Table # above the table in bold Font Size 12 and the heading in ordinary Font Size 12. Captions should be typed separately. Table legends should be informative and self-explanatory.

Footnotes: Footnotes should not be used.

Abbreviations: Try to use abbreviations sparingly. When used extensively, provide a list of all non-standard abbreviations on a separate page before the reference section. When symbols are used extensively, include a list of all symbols in the notation section. Do not abbreviate the word “Figure” or “Table” in titles or text.

References: References should be numbered consecutively in the order in which they are cited in the text. Cite in the text by the appropriate Arabic numeral enclosed in parentheses, e.g., (1) or (2-5), not super or sub scripted. References to unpublished personal communications should be avoided. Use () for reference citation in the text. Place punctuation AFTER the reference. For each reference, use a single continuous paragraph with no extra space or line break. Do not use “add-ins” such as EndNotes. Abbreviations for journal names should conform to those in the Bibliographic Guide for Editors and Authors (Americal Chemical Society, Washington, D.C.). The references should conform to the following style and punctuation: Journal Article: Davies NM, Jamali F. COX-2 selective inhibitors cardiac toxicity: Getting to the heart of the matter. J Pharm Sci, 7: 332-336, 2004. Book: Mutschler, E; Derendorf, H., Drug Actions, Basic Principles and Therapeutic

Aspects. CRC, Ann Arbor, MI, USA, 1995. Contribution to a Book: Jamali, F., Stereochemically Pure Drugs: An Overview, in Wainer IW; Drayer D (eds), Drug Stereochemistry: Analytical Methods and Pharmacology. 2nd ed., Marcel Dekker, INC, New York, NY, pp 375-384, 1993. Patent: E.A. Balazs, Ultrapure hyaluronic acid and the use thereof, U.S. Patent 4,141,973 (1979).

Acknowledgements: Acknowledgements of financial support, gifts, technical help or other assistance may be stated in an un-numbered paragraph under this heading preceding the references.

After Review

One set of page proofs (as PDF file) will be emailed to the corresponding author. Please use the PDF annotations function to list the corrections. Proofreading is solely your responsibility. Note that we may proceed with the publication of your article if no response is received.

Submission Ethics

It is necessary to agree upon standards of expected ethical behavior for all parties involved in the act of publishing: the author, the Journal editor, the peer reviewer and the publisher. Our ethic statements are based on COPE's Best Practice Guidelines for Journal Editors.

Publication decisions: The editor of the Journal is responsible for deciding which of the articles submitted to the Journal should be published. The editor may be guided by the policies of the Journal's editorial board and constrained by such legal requirements as shall be in force regarding libel, copyright infringement and plagiarism. The editor may confer with other editors or reviewers in making this decision.

Fair play: An editor will at any time evaluate manuscripts for their intellectual content without regard to race, gender, sexual orientation, religious belief, ethnic origin, citizenship, or political philosophy of the authors.

Confidentiality: The editor and any editorial staff must not disclose any information about a submitted manuscript to anyone other than the corresponding author, reviewers, potential reviewers, other editorial advisers and the publisher, as appropriate.

Disclosure and conflicts of interest: Unpublished materials disclosed in a submitted manuscript must not be used in an editor's own research without the express written consent of the author.

Duties of Reviewers

Contribution to editorial decisions: Peer review assists the editor in making editorial decisions and through the editorial communications with the author may also assist the author in improving the manuscript. Generative AI at <http://reviewpaperai.com> (<http://reviewpaperai.com>) is used to perform a preliminary review of received manuscripts.

Promptness: Any selected referee who feels unqualified to review the research reported in the manuscript or knows that its prompt review will be impossible should notify the editor and excuse himself/herself from the review process.

Confidentiality: Any manuscripts received for review must be treated as confidential documents. They must not be shown to or discussed with others except as authorized by the editor.

Standards of Objectivity: Reviews should be conducted objectively. Personal criticism of the author is inappropriate. Referees should express their views clearly with supporting arguments.

Acknowledgement of Sources: Reviewers should identify relevant published work that has not been cited by the authors. Any statement that an observation, derivation or argument had been previously reported should be accompanied by the relevant citation. A reviewer

should also call to the editor's attention any substantial similarity or overlap between the manuscript under consideration and any other published paper of which they have the personal knowledge.

Disclosure and Conflict of Interest: Privileged information or ideas obtained through peer review must be kept confidential and not used for personal advantage. Reviewers should not consider manuscripts in which they have conflicts of interest resulting from competitive, collaborative, or other relationships or connections with any of the authors, companies, or institutions connected to the papers.

Duties of Authors

Reporting standards: Authors of reports of original research should present an accurate account of the work performed as well as an objective discussion of its significance. Underlying data should be represented accurately in the paper. A paper should contain sufficient detail and references to permit others to replicate the work. Fraudulent or knowingly inaccurate statements constitute unethical behavior and are unacceptable.

Data access and Retention: Authors are asked to provide the raw data in connection with a paper for editorial review, and should be prepared to provide public access to such data (consistent with ALPSP-STM statement on Data and Databases), if practicable, and should in any event be prepared to retain such data for a reasonable time after publication.

Originality and Plagiarism: The authors should ensure that they have written entirely original works, and if the authors have used the work and/or words of others, that this is appropriately cited or quoted.

Multiple, Redundant or Concurrent Publication: An author should not in general publish manuscripts describing essentially the same research in more than one journal or primary publication. Submitting the same manuscript to more than one journal concurrently constitutes unethical publishing behavior and is unacceptable.

Acknowledgement of Sources: Proper acknowledgement of the work of others must always be given. Authors should cite publications that have been influential in determining the nature of the reported work.

Authorship of the paper: Authorship should be limited to those who have made a significant contribution to the conception, design, execution or interpretation of the reported study. All those who have made significant contributions should be listed as co-authors. Where there are others who have participated in certain substantive aspects of the research project, they should be acknowledged or listed as contributors. The corresponding author should ensure that all appropriate co-authors and no inappropriate co-authors are included in the paper, and that all co-authors have seen and approved the final version of the paper and have agreed to its submission for publication.

Disclosure and Conflicts of Interest: All authors should disclose in their manuscript any financial or other substantive conflict of interest that might be construed to influence the results or interpretation of their manuscript. All sources of financial support for the project should be disclosed.

Fundamental errors in published works: When an author discovers a significant error or inaccuracy in his/her own published work, it is the author's obligation to promptly notify the journal editor or publisher and cooperate with the editor to retract or correct the paper.

General guidelines for writing a scientific manuscript

Title: Choose a concise and informative title that accurately reflects the content of your research.

Abstract: Write a clear and succinct abstract that summarizes the objectives, methods, key findings, and implications of your study.

Introduction: Provide a comprehensive overview of the background and significance of your research, including a clear statement of the research question or hypothesis.

Materials and Methods: Describe your study design, materials, and methods in sufficient detail to allow replication of the study. Include information about data collection, measurements, and statistical analyses.

Results: Present your findings in a logical and organized manner, using tables, figures, and graphs where appropriate. Provide clear and concise descriptions of the results without interpretation or speculation.

Discussion: Interpret your results and relate them to existing literature. Discuss the implications of your findings and any limitations or potential biases in your study. Consider alternative explanations and address potential future directions for research.

Conclusion: Summarize the main findings of your study and their broader implications. Avoid overstating or making claims beyond the scope of your research.

References: Cite all relevant sources accurately and consistently following the appropriate citation style (e.g., APA, MLA, or specific journal guidelines). Ensure that your references are up to date and include a wide range of sources to demonstrate a thorough review of the existing literature.

Structure: Organize your manuscript into logical sections (e.g., Introduction, Methods, Results, Discussion) with clear headings. Use subheadings to further divide sections, if necessary.

Clarity and Conciseness: Use clear and precise language to convey your ideas. Avoid jargon

and define technical terms when necessary. Eliminate unnecessary words or information that do not contribute to the main message.

Figures and Tables: Ensure that all figures and tables are clear, well-labeled, and directly support the main findings of your research. Include captions that provide sufficient context and interpretation.

Ethical Considerations: Address any ethical concerns related to your research, such as human or animal subjects, conflicts of interest, or informed consent. Adhere to ethical guidelines and obtain necessary approvals.

Proofreading and Editing: Thoroughly proofread your manuscript for grammatical errors, typos, and formatting inconsistencies. Seek feedback from colleagues or mentors to improve clarity and readability.

Journal Guidelines: Familiarize yourself with the specific guidelines and formatting requirements of your target journal. Adhere to their instructions regarding word limits, referencing style, manuscript structure, and supplementary materials.

Review and Revision: Be open to reviewer comments and revise your manuscript accordingly. Address each comment thoughtfully and provide clear responses or revisions when submitting a revised version.

Intellectual Property: Respect intellectual property rights by properly attributing and referencing the work of others. Obtain permission for the use of copyrighted material, such as figures or tables, when necessary.

Accurate Data and Analysis: Ensure the accuracy and integrity of your data and analysis.

Double-check calculations, statistical methods, and reported results for errors.

Reproducibility: Provide sufficient details and documentation of your methods, materials, and data to enable other researchers to replicate your study.

Writing Style: Write in a clear, concise, and engaging manner. Use active voice, appropriate verb tenses, and consistent terminology throughout the manuscript.

Persistence and Resilience: Be prepared for the possibility of rejection or revisions. Scientific publishing is a competitive process, so maintain a positive attitude and be persistent in your efforts to improve and disseminate your research.
